Southern Plains Windbreak Renovation and Innovation Workshop
May 21 – 23, 2013
Dodge City, KS

In response to the success of the Great Plains Windbreak Renovation and Innovation Conference held last year in North Dakota, the Plains and Prairie Forestry Association along with state and federal agencies are planning a workshop to learn about windbreak renovation and innovation concepts and issues of the Southern Plains region.

Windbreaks and shelterbelts are barriers used to reduce wind speed. Usually consisting of trees and shrubs..., or other materials. They are used to protect crops and livestock, control erosion, and blowing snow, define boundaries, provide habitat for wildlife, provide tree products, and improve landscape aesthetics. - Brandle, J.R., Hodges, L., Tyndall, J., Sudmeyer, R., 2009. In: North American Agroforestry; An Integrated Science and practice, 2nd edition

This workshop will bring together technical expertise and experience to facilitate learning and sharing about windbreak renovation and how to incorporate innovation into the design and management of windbreaks to address current and future needs and issues and to make windbreaks truly multifunctional.

A three-day conference will take place in Dodge City, Kansas on May 21 – 23, 2013. One day of this workshop will be devoted to a windbreak field tour designed to illustrate many of the concepts that the attendees will learn.

Mark your calendars and plan to join us
